Executive Summary

Kentucky's overall age-adjusted injury mortality rate was 91.3 per 100,000 Kentucky resident population in 2017. The male and female age-adjusted rates were 126.1 and 58.2, respectively.

The age-adjusted rate for injury-related inpatient hospitalizations per 100,000 population was 501.4 per 100,000 Kentucky resident population in 2017. The male and female age-adjusted rates were 491.9 and 493.4, respectively.

The age-adjusted rate for injury-related emergency department visit discharges per 100,000 Kentucky resident population was 11,747.2 in 2017. The male and female age-adjusted rates were 12,061.5 and 11,366.5, respectively.

Fatalities

There were 4,083 injury fatalities among Kentucky residents in 2017. The leading mechanisms of injury fatality for Kentucky residents in 2017 were *drug poisonings* (1,548), *motor vehicle traffic crashes* (697), and *firearms* (683). Ninety-three percent of the poisonings were unintentional drug overdoses involving prescription medications and/or illicit drugs. The leading injury mechanisms among intentional deaths (suicides and homicides) were *firearms* (64%) and *suffocation/hanging* (18%).

There were 954 fatalities from traumatic brain injuries (TBI), where TBI was reported as a cause of death on the death certificate alone or in combination with other injuries or conditions. The majority of the TBI-related fatalities were either intentional (51%) or unintentional (49%).

Inpatient Hospitalizations

There were 24,198 injury-related inpatient hospitalization encounters among Kentucky residents in 2017. The leading mechanisms of injury-related inpatient hospitalizations were *falls* (11,668), *drug poisonings* (4,207), and *motor vehicle traffic crashes* (2,699). The majority of unintentional fall-related hospitalizations occurred among Kentucky residents age 55 years and older (88%). Of the 4,390 drug poisonings, 2,475 (59%) were unintentional and 1,613 (38%) were self-directed/inflicted. The leading mechanism of intentional injury-related inpatient hospitalizations was *drug poisoning* (63%).

TBI (either TBI alone or in combination with other injuries) accounted for 2,994 hospitalizations. The majority of the TBI-related inpatient hospitalizations were unintentional (86%). Falls were the leading mechanism of TBI-related hospitalizations (52%).

Emergency Department Visits

There were 508,141 injury-related emergency department (ED) visits among Kentucky residents in 2017. The leading mechanisms of injury-related ED visits were *falls* (147,428), *being struck by or against an object or person* (67,488), *motor vehicle traffic crashes* (56,686), and *overexertion* (34,250). The leading mechanism of intentional injury-related ED visits was *struck by/against* (11,930).

TBI (either TBI alone or in combination with other injuries) accounted for 11,652 ED visits. The majority of the TBI-related ED visits were unintentional (86%). Falls were the leading mechanism of TBI-related ED visits (39%).

Data Sources and Methods

Data Sources

All data are provisional and subject to change.

Population Data

U.S. Census, Population Division. "Annual Estimates of the Resident Population by Single Year of Age and Sex for the U.S., States, and Puerto Rico Commonwealth: 2017 Population Estimates." Population is limited to Kentucky residents.

Mortality Data

Kentucky Death Certificate Database, Kentucky Office of Vital Statistics, Cabinet for Health and Family Services, Frankfort, KY.

Inpatient Hospitalization Discharge Data

Kentucky Inpatient Hospitalization Claims Files, Office of Health Data and Analytics, Cabinet for Health and Family Services, Frankfort, KY. Note: Counts represent encounters of care and could be greater than the number of individual patients treated at an acute care facility.

Emergency Department Visit Discharge Data

Kentucky Outpatient Services Database, Office of Health Data and Analytics, Cabinet for Health and Family Services, Frankfort, KY. Note: Counts represent encounters of care and could be greater than the number of individual patients treated.

Methods

All data were limited to Kentucky residents.

Injury Fatalities

The definitions for fatal injuries used in this report correspond to the Centers for Disease Control and Prevention (CDC)'s "State injury indicators report: Instructions for preparing 2017 data." The underlying cause of death field was used to identify the mechanism and manner of fatal injuries.

PLEASE NOTE: Death counts in this report are based on state death certificate files and thus cannot be expected to match counts based on other sources. In particular, numbers of motor vehicle traffic deaths will not match those based on police collision reports (PCRs) because the two systems do not report on identical underlying populations. Death certificates capture deaths of Kentucky residents regardless of where they occur; PCRs capture deaths that occur on Kentucky roads only, regardless of state of residence. Similarly, counts of homicides and assaults in this report will not match counts based on police crime reports. These data sources should be viewed as complementary. There also exist specialized, death certificate-based surveillance systems for injury fatalities at both the state (e.g., the Kentucky Violent Death Reporting System and Child Fatality Reviews) and national levels (e.g., CDC's Web-Based Injury Statistics Query and Reporting System/WISQARS™ and Wide-ranging Online Data for Epidemiologic Research/WONDER). Counts from those systems may not exactly match counts in this report due to differences in inclusion criteria, case definitions, the use of ancillary data sources for case identification, or other factors.

Injury Inpatient Hospitalizations

The definitions for injury hospitalizations used in this report correspond to the Council for State and Territorial Epidemiologists (CSTE) Injury Surveillance Toolkit. Hospitalizations were limited to discharges from nonfederal, acute care, or inpatient facilities. CDC's proposed surveillance definitions for injury hospitalizations were used; only initial encounters were included (indicated by a seventh character of "A" or missing in the International Classification of Diseases, Tenth Revision, Clinical Modification [ICD-10-CM] code). The injury subset for hospitalizations was created by selecting discharges having a principal diagnosis code. The CDC's ICD-10-CM Poisoning and Non-Poisoning Matrices were used to categorize the injuries by mechanism and intent. The external causes of morbidity, which were used to provide injury details (e.g., intent, mechanism), are not required for discharge billing purposes; therefore, every injury hospitalization may not have this level of detail.

PLEASE NOTE: In October 2015, healthcare discharge data (injury hospitalization encounters) coding systems transitioned from ICD-9-CM to ICD-10-CM. The coding system transition should be considered when interpreting the data, and trend analysis using ICD-9-CM coded data for some years and ICD-10-CM coded data for other years is not recommended due to substantial differences and a lack of one-to-one correspondence between ICD-9-CM and ICD-10-CM.

Injury Emergency Department Visits

The definitions for injury emergency department (ED) visits used in this report correspond to the CSTE Injury Surveillance Toolkit. The CDC's proposed surveillance definitions for injury ED visits were used; only initial encounters were included (seventh character of "A" or missing) in the ED dataset using diagnosis codes or external cause codes. The CDC's ICD-10-CM Poisoning and Non-Poisoning Matrices were used to categorize the injuries by mechanism and intent. The external causes of morbidity, which were used to provide injury details (e.g., intent, mechanism) are not required for discharge billing purposes; therefore, every injury ED visit may not have this level of detail.

PLEASE NOTE: In October 2015, healthcare discharge data (emergency department visit encounters) coding systems transitioned from ICD-9-CM to ICD-10-CM. The coding system transition should be considered when interpreting the data, and trend analysis using ICD-9-CM coded data for some years and ICD-10-CM coded data for other years is not recommended due to substantial differences and a lack of one-to-one correspondence between ICD-9-CM and ICD-10-CM.

Calculation of Rates and Data Presentation

Two types of rates are reported. Age-specific ("crude") rates were calculated by dividing the number of injury events occurring in a particular age group by the estimated number of Kentucky residents in that age group in 2017 and multiplying by 100,000. Age-adjusted rates were adjusted to the year 2000 standard population. Rates based on counts of 20 or fewer may be unstable.

Data are presented as aggregated counts. Certain counts have been suppressed because either the observed number of injury events is very small (a count of at least one but fewer than five) and not appropriate for publication or the count can be used to calculate the number in a count that has been suppressed.

Definitions for “Leading Cause” by Age Group and Intent Injury Mortality and Discharge Data Matrices

Motor vehicle non-traffic (MV non-traffic)—Includes motor vehicle crashes that occurred somewhere other than on a public roadway.

Motor vehicle traffic (MV traffic)—This includes crashes that occurred on a public roadway and involved at least one motor vehicle. All persons injured in MV traffic incidents are counted here. Pedal cyclists and pedestrians who were struck by a motor vehicle would be counted here, but those who crashed on a public roadway without involvement of a motor vehicle would be counted elsewhere (see “Pedal Cyclist, Other” definition).

Natural/Environmental—Natural or environmental causes (insect bites and stings, animal bites, extreme weather, excessive heat or cold, etc.).

Other Land Transport—Other land transportation. Includes motor vehicle crashes that occurred somewhere other than on a public roadway, rail injuries, etc. Does not include air or water injuries.

Other Specified—Other specified cause of injury. Includes a variety of relatively low-incidence causes of injury grouped together. Includes causes not elsewhere classified; an external cause of injury code that is intended for use when no other code exists to adequately describe the mechanism and manner of injury.

Pedal Cyclist, Other—Includes pedal cyclists who crashed on a public roadway without involvement of a motor vehicle.

Poisoning—Includes drug and non-drug poisonings, unless otherwise noted.

Tie—Indicates a tied count for a leading cause of injury-related mortality or morbidity.

Unspecified—Injuries for which an external code of injury either (a) was not specified or (b) was specified but did not indicate the mechanism or manner of injury.

10 Leading Causes of Injury-Related Fatality by Age Group and Intent, 2017 Kentucky Residents

Rank	Under 12 years old	12–17 years old	18–24 years old	25–34 years old	35–44 years old	45–54 years old	55–64 years old	65 years and older
